

# PENETRATION TESTING REPORT

Generated: December 04, 2025

# Security Assessment Report

\*\*Target:\*\* 192.168.1.100

\*\*Assessment Date:\*\* [Current Date]

\*\*Assessed By:\*\* Penetration Testing Team

---

## 1. EXECUTIVE SUMMARY

### ### Security Posture Overview

The target system at 192.168.1.100 presents a \*\*CRITICAL\*\* security risk with multiple high-severity vulnerabilities that could lead to complete system compromise. The assessment identified significant weaknesses in the web application, server configuration, and security hardening practices.

### ### Vulnerability Summary

- \*\*Total Vulnerabilities Found:\*\* 7
- \*\*Overall Risk Rating:\*\* CRITICAL
- \*\*Critical Vulnerabilities:\*\* 1
- \*\*High Vulnerabilities:\*\* 3
- \*\*Medium Vulnerabilities:\*\* 2
- \*\*Low Vulnerabilities:\*\* 1

### ### Key Findings

The most concerning finding is a SQL injection vulnerability that allows complete database access. Combined with an exposed MySQL service and outdated software components, an attacker could achieve full system compromise.

---

## 2. VULNERABILITY SUMMARY

| Severity     | Vulnerability                       | Affected Component | CVE                            |
|--------------|-------------------------------------|--------------------|--------------------------------|
| -----        | -----                               | -----              | ----                           |
| **Critical** | SQL Injection (Boolean-based blind) | login.php          | N/A                            |
| **High**     | Exposed MySQL Service               | Port 3306          | N/A                            |
| **High**     | Outdated Apache Version             | Apache 2.4.6       | CVE-2017-15710, CVE-2017-15715 |
| **High**     | Directory Indexing Enabled          | /backup/ directory | N/A                            |
| **Medium**   | Missing Security Headers            | Web Application    | N/A                            |
| **Medium**   | Information Disclosure via ETags    | Apache Server      | N/A                            |
| **Low**      | SSH Service Exposed                 | Port 22            | N/A                            |

---

### 3. DETAILED FINDINGS

#### ### ■ CRITICAL - SQL Injection Vulnerability

**\*\*Description:\*\*** A boolean-based blind SQL injection vulnerability exists in the username parameter of the login form.

**\*\*Affected Component:\*\*** `/login.php` - username parameter (POST method)

**\*\*Severity Rating:\*\*** Critical - Allows complete database compromise

**\*\*Proof of Concept:\*\***

---

Parameter: username (POST)

Payload: username=admin' AND 1=1-- -&password;=test

Database: webapp\_db (MySQL 5.7.33)

---

#### **\*\*Business Impact:\*\***

- Complete database compromise and data exfiltration
- Potential privilege escalation to system level
- Loss of data confidentiality, integrity, and availability
- Regulatory compliance violations (GDPR, PCI-DSS)
- Reputation damage and financial losses

---

#### ### ■ HIGH - Exposed MySQL Database Service

**\*\*Description:\*\*** MySQL database service is directly accessible from the network on port 3306.

**\*\*Affected Component:\*\*** MySQL 5.7.33 service

**\*\*Severity Rating:\*\*** High - Direct database access risk

**\*\*Evidence:\*\*** Port 3306/tcp open mysql MySQL 5.7.33

#### **\*\*Business Impact:\*\***

- Direct database attacks and brute force attempts
- Potential data breach if weak credentials exist
- Bypass of application-layer security controls

---

#### ### ■ HIGH - Outdated Apache Web Server

**\*\*Description:\*\*** Apache web server version 2.4.6 contains multiple known security vulnerabilities.

**\*\*Affected Component:\*\*** Apache HTTP Server 2.4.6

**\*\*Severity Rating:\*\*** High - Known exploitable vulnerabilities

**\*\*Evidence:\*\*** Multiple CVEs including CVE-2017-15710, CVE-2017-15715

#### **\*\*Business Impact:\*\***

- Remote code execution potential
- Server compromise and lateral movement

- Service disruption and data theft

---

### ### ■ HIGH - Directory Indexing Enabled

**\*\*Description:\*\*** Directory listing is enabled on the `/backup/` directory, potentially exposing sensitive files.

**\*\*Affected Component:\*\*** `/backup/` directory

**\*\*Severity Rating:\*\*** High - Information disclosure

**\*\*Evidence:\*\*** Directory indexing enabled on /backup/

**\*\*Business Impact:\*\***

- Exposure of sensitive backup files
- Information gathering for further attacks
- Potential access to configuration files and credentials

---

### ### ■ MEDIUM - Missing Security Headers

**\*\*Description:\*\*** Critical security headers are missing, leaving the application vulnerable to various client-side attacks.

**\*\*Affected Component:\*\*** Web application responses

**\*\*Severity Rating:\*\*** Medium - Client-side attack vectors

**\*\*Evidence:\*\*** Missing X-Frame-Options, X-Content-Type-Options headers

**\*\*Business Impact:\*\***

- Clickjacking attacks
- MIME type confusion attacks
- Cross-site scripting (XSS) exploitation

---

### ### ■ MEDIUM - Information Disclosure via ETags

**\*\*Description:\*\*** Server leaks inode information through ETag headers.

**\*\*Affected Component:\*\*** Apache web server

**\*\*Severity Rating:\*\*** Medium - Information disclosure

**\*\*Evidence:\*\*** Server leaks inodes via ETags

**\*\*Business Impact:\*\***

- Information gathering for targeted attacks
- Server fingerprinting and reconnaissance

---

### ### ■ LOW - SSH Service Exposure

**\*\*Description:\*\*** SSH service is accessible from the network, presenting a potential attack vector.

**\*\*Affected Component:\*\*** OpenSSH 7.4 on port 22

**\*\*Severity Rating:\*\*** Low - Standard service exposure

**\*\*Evidence:\*\*** 22/tcp open ssh OpenSSH 7.4

**\*\*Business Impact:\*\***

- Brute force attack potential
- Credential stuffing attacks

---

## 4. REMEDIATION RECOMMENDATIONS

### ### Priority 1 - IMMEDIATE ACTION REQUIRED

#### #### Critical: SQL Injection Vulnerability

- **Action:** Implement parameterized queries/prepared statements
- **Effort:** Medium
- **Timeline:** 24-48 hours
- **Prevention:**
  - Input validation and sanitization
  - Web Application Firewall (WAF) implementation
  - Regular security code reviews

#### #### High: Disable MySQL External Access

- **Action:** Configure MySQL to bind only to localhost (127.0.0.1)
- **Effort:** Low
- **Timeline:** Immediate
- **Prevention:** Network segmentation and firewall rules

### ### Priority 2 - SHORT TERM (1-2 weeks)

#### #### High: Update Apache Web Server

- **Action:** Update to latest stable Apache version (2.4.54+)
- **Effort:** Medium
- **Timeline:** 1 week
- **Prevention:** Implement automated patch management

#### #### High: Disable Directory Indexing

- **Action:** Add `Options -Indexes` directive to Apache configuration
- **Effort:** Low
- **Timeline:** Immediate
- **Prevention:** Secure Apache configuration baseline

### ### Priority 3 - MEDIUM TERM (2-4 weeks)

#### #### Medium: Implement Security Headers

- **Action:** Configure security headers in web server/application
- **Effort:** Low
- **Timeline:** 1 week
- **Headers to implement:**
  -

...

X-Frame-Options: DENY  
X-Content-Type-Options: nosniff  
X-XSS-Protection: 1; mode=block  
Strict-Transport-Security: max-age=31536000  
---

#### #### Medium: Fix ETag Information Disclosure

- **Action:** Configure Apache to use non-inode based ETags
- **Effort:** Low
- **Timeline:** 1 week
- **Configuration:** `FileETag MTime Size`

#### ## Priority 4 - LONG TERM

##### #### Low: Secure SSH Access

- **Action:** Implement SSH hardening measures
- **Effort:** Low
- **Timeline:** 2 weeks
- **Recommendations:**
  - Disable root login
  - Implement key-based authentication
  - Configure fail2ban
  - Change default port if feasible

---

## 5. CONCLUSION

### ## Overall Security Posture Assessment

The target system presents a **CRITICAL** security risk that requires immediate attention. The combination of SQL injection vulnerability, exposed database service, and outdated software creates a perfect storm for system compromise.

### ## Immediate Priority Vulnerabilities

1. **SQL Injection** - Must be fixed within 24-48 hours
2. **MySQL External Access** - Should be disabled immediately
3. **Outdated Apache Server** - Update within one week

### ## Long-term Security Recommendations

#### #### Infrastructure Security

- Implement network segmentation
- Deploy Web Application Firewall (WAF)
- Establish automated patch management
- Configure comprehensive logging and monitoring

#### #### Application Security

- Conduct regular security code reviews
- Implement secure coding practices
- Perform periodic penetration testing
- Establish vulnerability management program

#### #### Operational Security

- Create incident response procedures
- Implement security awareness training
- Establish change management processes
- Regular security assessments and audits

#### ### Risk Acceptance

**\*\*RECOMMENDATION:\*\*** Do not accept current risk levels. The critical SQL injection vulnerability poses an unacceptable risk of data breach and should be remediated immediately before the system continues operation in a production environment.

---

**\*\*Report Classification:\*\*** CONFIDENTIAL

**\*\*Next Assessment:\*\*** Recommended within 30 days post-remediation
